RELEASE READINESS ASSESSMENT

TECHNICAL DUE DILIGENCE REPORT

An external review of the production web surface across performance, security, accessibility, infrastructure, and content.

taekworld.com

TARGET SURFACE **taekworld.com**	AUDITOR **Test Company**
METHODOLOGY **3-Track Parallel Review**	ACCESS LEVEL **External Only · No Source**

01 · METHOD & SCOPE

Three parallel review tracks were executed against the public production surface. We possessed no source code access; everything detailed below is externally verifiable via HTTP inspection, network interception, and headless rendering analysis.

TRACK 01

Frontend

Analysis of rendered HTML, meta tags, semantic structure, accessibility ARIA attributes, viewport directives, and mobile zoom policies. Evaluates client-side DOM integrity.

TRACK 02

Backend & Infra

Inspection of TLS, security response headers (HSTS, CSP), CORS policies, redirect chains, DNS configurations, edge CDN identification, caching policies, and email auth (SPF/DMARC).

TRACK 03

Performanc

Measurement of page weight, font loading waterfalls, CSS/JS render-blocking delivery, image pipeline optimization (Next/Image vs native), TTFB, HTTP/2 multiplexing, and Core Web Vitals.

Five scored categories · Weighted average aggregation · Feature-scan applied against three release scenarios

TAEKWORLD.COM

70

OUT OF 100

SOFT-LAUNCH READY

Known issues acceptable for limited audience. Fix warnings before B2B scaling.

Score Interpretation Scale

0-19	20-39	40-59	60-79	80-100
Foundation	**Not Ready**	**Beta At Best**	**Soft-Launch**	**Release-Ready**
Major rework required. Do not release.	Critical blockers present. Requires remediation.	Significant gaps in core areas. Unstable.	Known issues acceptable for limited audience.	Minor polish only. Scalable to B2B enterprise.

03 · CATEGORY: PERFORMANCE

TAEKWORLD.COM

LIGHTHOUSE SCORE

42/10

Poor performance. Assets are heavily render-blocking.

Core Web Vitals Telemetry

LCP (LARGEST CONTENTFUL PAINT)

9.1 s

Measures loading performance. Target: < 2.5s.

CLS (CUMULATIVE LAYOUT SHIFT)

0

Measures visual stability. Target: < 0.1.

TBT (TOTAL BLOCKING TIME)

640 ms

Measures interactivity delays. Target: < 200ms.

FCP (FIRST CONTENTFUL PAINT)

0.6 s

Measures first pixel render. Target: < 1.8s.

Asset Pipeline Evaluation

Font Preloads

Excessive preloading blocks the main render thread.

733 files

CSS / JS Delivery

Number of external stylesheets and scripts requested.

3 CSS / 21 JS

Image Optimization Pipeline

0 / 0

Ratio of Next.js optimized images vs standard tags.

04 · SECURITY & INFRASTRUCTURE

TAEKWORLD.COM

Security & DNS

Verifiable security headers protect the application from XSS, clickjacking, and man-in-the-middle attacks. DNS records ensure corporate email integrity and prevent domain spoofing.

Strict-Transport-Security (HSTS) — **Enabled**

Forces browsers to use secure HTTPS connections.

Content-Security-Policy (CSP) — **Missing**

Mitigates cross-site scripting (XSS) by restricting asset sources.

SPF / DMARC Records — **SPF DMARC**

Essential for preventing email spoofing and domain reputation damage.

Infrastructure (Inferred)

Network footprints reveal the underlying architecture. We check for Edge CDN presence, Server-Side Rendering (SSR) capabilities, and potential routing bailouts.

Tech Stack Fingerprint — **Next.js, V...**

Frameworks inferred from DOM and headers (e.g. Next.js, Vercel).

Rendering Mode — **SSR / SSG Validated**

Client-Side Rendering (CSR) blocks search engines from reading initial content.

CDN Edge Provider — **Vercel**

Validates global content distribution (e.g., Cloudflare, Vercel).

05 · CRITICAL BLOCKERS & ACTION PLAN

The following list represents the immediate remediation roadmap. These items severely degrade Search Engine Optimization, User Experience, or Security. Resolution of these items is mandatory before moving to the next release phase.

1

Impact: Failure to resolve this limits visibility in organic search indices and reduces conversion rates by creating UX friction or crawlability barriers. Engineering teams must prioritize this in the upcoming sprint.

2

Impact: Failure to resolve this limits visibility in organic search indices and reduces conversion rates by creating UX friction or crawlability barriers. Engineering teams must prioritize this in the upcoming sprint.

3

Impact: Failure to resolve this limits visibility in organic search indices and reduces conversion rates by creating UX friction or crawlability barriers. Engineering teams must prioritize this in the upcoming sprint.

APPENDIX · WHAT WE CANNOT ASSESS

TRANSPARENCY STATEMENT

In our commitment to providing a transparent and truthful technical audit, we explicitly define the boundaries of our external scan. The following areas cannot be accurately assessed without direct access to the source code, AWS/GCP consoles, and internal server environments.

1. Backend API Security

Parameter manipulation, SQL injection vulnerabilities, and internal endpoint security remain outside the scope of an external footprint scan.

2. Database Architecture

Performance of SQL queries, use of advanced extensions, indexing strategy, and database scaling bottlenecks cannot be inferred.

3. Token Flow Integrity

4. Code Quality & Debt

Refresh token lifecycles, JWT signing keys, and server-side validation mechanics for authentication systems are hidden from external observation.

Test coverage percentages, architectural design patterns, CI/CD pipeline stability, and internal technical debt cannot be evaluated.
